Laboratory Quality Management Training: Guiding Principles to Promote a Culture of Biosafety, Biosecurity, and Responsible Conduct in the Life Sciences

An organizational culture of biosafety, biosecurity, and responsible conduct in the life sciences fosters quality activities that aim to develop new treatments and therapeutics, strengthen health research systems, and promote public, animal, and environmental health surveillance and response activities. These elements are essential to protecting and improving health security and wellness of people, animals, and the environment.

Laboratories working with biological agents and toxins operate under rigorous regulations and requirements to provide the appropriate levels of protection for public and agricultural health through personnel training on biosafety and biosecurity, bioethics, occupational health, and quality management. Such training is designed to meet quality and regulatory objectives and to provide individuals with the knowledge, skills, and abilities necessary to be competent in their assigned duties and responsibilities. The training should also emphasize the need to exercise a general duty of care to protect the health and safety of individuals as well as the environment.

Laboratory incidents may lead to significant costs in time, personnel efforts, and patient outcomes as well as potential risks to the health security of individuals, communities, animals, plants, and the environment. A vigorous quality management system does not guarantee an incident-free organization but it can rapidly identify issues when they occur and help prevent them from reoccurring.

Strengthening an organizational culture of biosafety, biosecurity, and responsible conduct in the life sciences is an intrinsic part of a quality management system and it implies devoting training resources and consideration to: management systems (organization and leadership); leadership and personnel behavior; principles for guiding decisions and behavior; and beliefs and attitudes on biosafety, biosecurity and responsible conduct of research.

Performing assigned duties and responsibilities in a safe, secure, and responsible manner is a core competency and must be emphasized during the competency assessment (which affirms that training is effective and personnel competently apply knowledge, skills, and abilities to meet the standards of their professional practice).
The organizational culture of biosafety, biosecurity, and responsible conduct in the life sciences may be addressed as part of the safety and security training component of laboratory quality management systems while taking into account that laboratory training and competency assessment approaches will vary with local context, including requirements (organizational, regulatory, accreditation), quality management systems, path of workflow processes and procedures, and composition of personnel.
